

API Exploration Report

API Used

JSONPlaceholder Public API

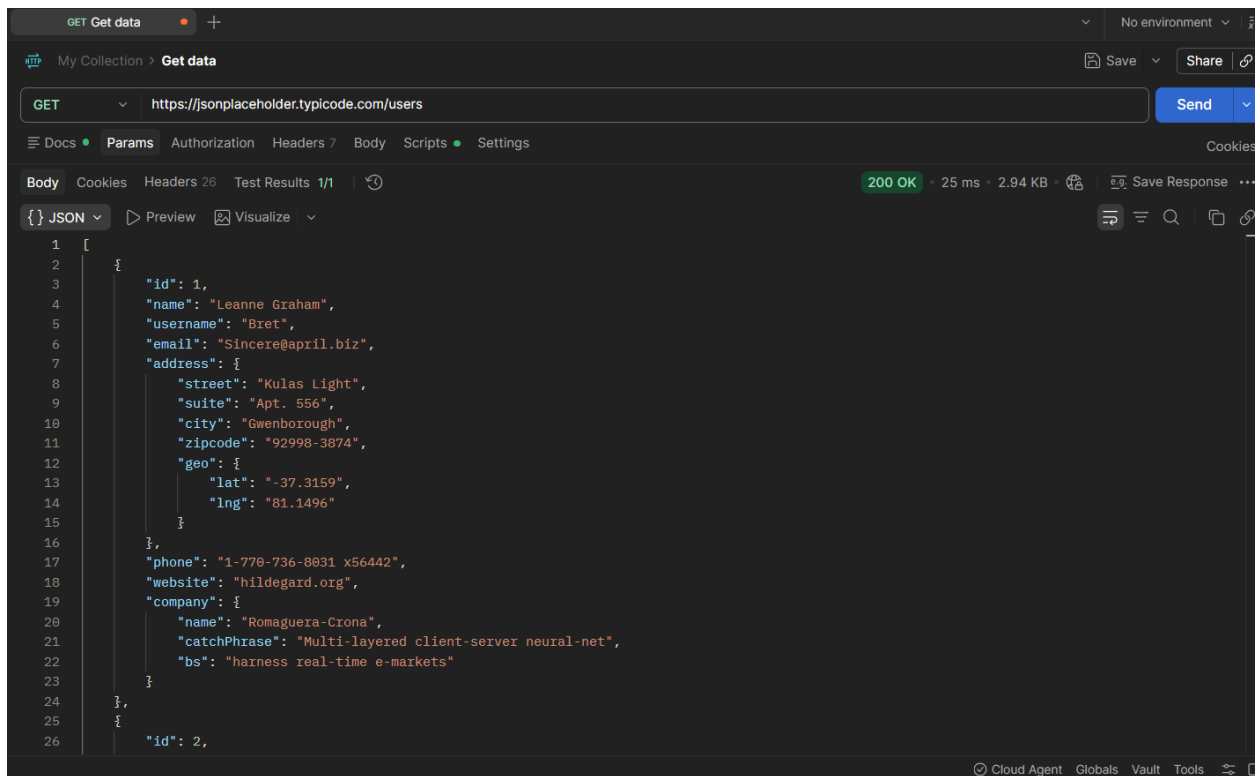

The API returns a **JSON array**.

Each element of the array is a **JSON object** representing one user.

Each object contains:

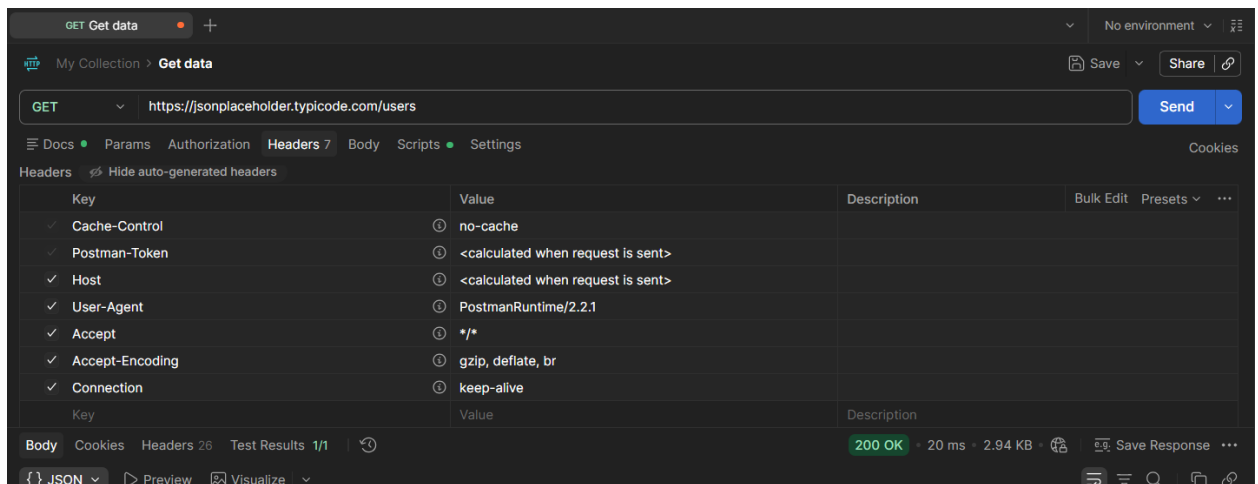

- id
- name
- username
- email
- address (nested object)
- phone
- website
- company (nested object)

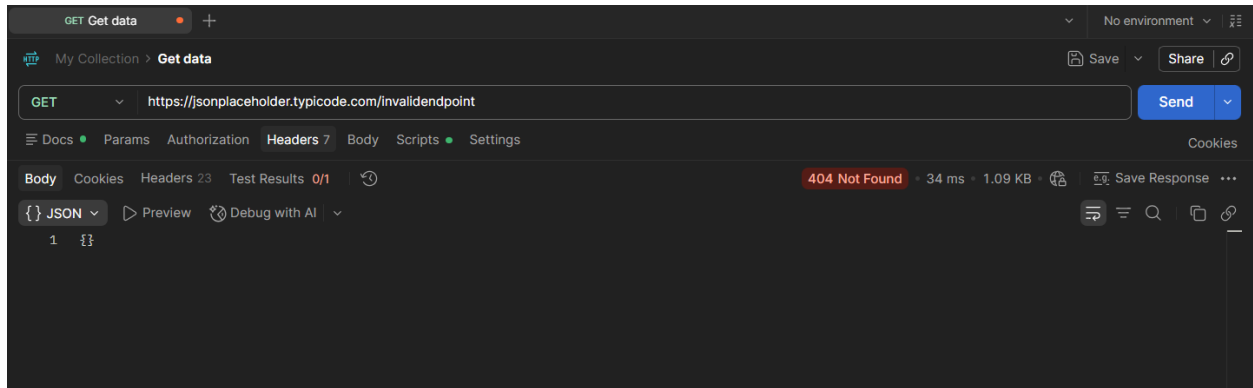

This demonstrates both simple key-value pairs and nested JSON objects.

Headers:

No custom headers were required. Postman automatically generated the standard HTTP request headers.

The requested endpoint `/invalidendpoint` does not exist on the server, so the server returned a 404-response indicating that the requested resource could not be found.

What I Learned

- How APIs communicate using HTTP requests.
- The difference between requests and responses.
- How JSON data is structured.
- The meaning of common HTTP status codes.
- How Postman can be used to test REST APIs.
